1
US-01 — Log Time Against Project Task
Done
Agents
Improve Story
Description
As a Remote Developer, I want to log time against a specific project task, so that my hours are accurately tracked and billable. Acceptance criteria: Pass — valid timesheet submitted for approval. Fail — a 30-hour single-day entry is accepted.

1
US-02 — Edit/Delete Draft Time Entry
Done
Agents
Improve Story
Description
As a Remote Developer, I want to edit or delete a time entry while it is still in Draft status, so that I can correct mistakes before submission. Acceptance criteria: Pass — editing an approved entry is blocked with a locked error. Fail — an approved entry is modified.

US-03 — Submit Timesheet for Approval
Done
Agents
Improve Story
Description
As a Remote Developer, I want to submit my completed weekly timesheet for approval, so that my manager can review and approve my hours. Acceptance criteria: Pass — a fully validated timesheet moves to Pending Approval. Fail — an unvalidated timesheet is submitted successfully.

US-04 — Approve/Reject Timesheet with Comment
Done
Agents
Improve Story
Description
As an Engineering Manager, I want to approve or reject a submitted timesheet with a mandatory comment on rejection, so that developers get clear, actionable feedback. Acceptance criteria: Pass — rejecting without a comment is blocked. Fail — a rejection is recorded with no comment.

US-05 — Budget Burn Threshold Alert
Done
Agents
Improve Story
Description
As an Engineering Manager, I want to be automatically notified when a project's budget burn rate crosses a warning threshold, so that I can take corrective action before an overrun. Acceptance criteria: Pass — a notification fires exactly when the threshold is reached. Fail — no notification fires.

US-06 — Real-Time Dashboard Updates
Done
Agents
Improve Story
Description
As an Engineering Manager, I want approval status and budget burn dashboards to update within 500 ms, so that I always see current, trustworthy project data. Acceptance criteria: Pass — benchmark tests confirm the 500 ms target under peak load. Fail — updates take longer.

US-07 — Platform Availability
Done
Agents
Improve Story
Description
As a Remote Developer or Engineering Manager, I want the platform to be reliably available, so that I can log or review timesheets at any time regardless of time zone. Acceptance criteria: Pass — monthly uptime ≥ 99.5%. Fail — uptime drops below 99.5%.

Reflection Questions:

1. Did your estimations reflect the actual effort?
Since this was a simulated sprint rather than real development work, story points measured relative complexity rather than actual coding time. Higher points (5) went to the submission and approval stories (US-03, US-04), which involve more validation logic and cross-actor interaction, while simpler stories like logging or editing a time entry scored lower (2-3). All items in the Epic views show 100% Done with points matching the original estimates exactly (Epic-01: 5 pts, Epic-02: 10 pts, Epic-03: 6 pts, Epic-04: 2 pts) — so while I can't validate actual time-to-build, the relative sizing logic held up consistently across every story.

2. Was your backlog well-prioritized?
Yes — the Sprint Reports confirm this directly. Sprint 1 contains exactly the four High-

priority stories (US-01 to US-04, core logging/approval workflow), and Sprint 2 contains exactly the three Medium-priority stories (US-05 to US-07, budget monitoring and reliability). The foundational, business-critical functionality was sequenced first, with supporting features deferred to the second sprint — matching the intended priority order with no exceptions.

3. How did your simulated sprint align with your plan?
Both sprints matched the plan exactly: Sprint 1 completed all 4 planned stories (15 points), Sprint 2 completed all 3 planned stories (8 points), and every Epic now shows 100% Done with zero items remaining or carried over. The only deviation visible in the Sprint 2 report is that all three of its stories are flagged with an asterisk ("issue added to sprint after start time") — this happened because the stories were dragged in right as the sprint began rather than being pre-populated in the backlog beforehand. It's a sequencing detail in how I ran the simulation, not an actual change in what was planned versus delivered.

4. What insights did the burndown chart give about your team's capacity?
Both burndown charts show a steep, near-vertical drop to zero within roughly 25-35 minutes of the sprint starting, rather than a gradual diagonal decline toward the grey guideline line. This reflects the compressed nature of the simulation — all stories were moved to Done in one sitting rather than worked on steadily over the sprint's full duration. In a real sprint with actual development work, I'd expect the burndown line to track much closer to the guideline, decreasing gradually as each story is completed across multiple days. A real team burning down this fast, this early, would typically be read as a sign they under-committed to the sprint and could safely take on more work in future planning.
